DATA VALIDATION SUMMARY REPORTS

Data Validation Summary Report
for the Site Investigation Performed at the
Former Decontamination Complex Building 1271 (Parcel FTA-93)
Fort McClellan, Calhoun County, Alabama

1.0 Introduction

Level III data validation was performed on 100% of the environmental samples collected at Parcel FTA-93. The analytical data consisted of eleven sample delivery groups (SDG's), PK49301 through PK49310 and WSHED05, which were analyzed by Quanterra Incorporated. Both soil and water matrices were validated. In addition, an evaluation of the field split data, which was analyzed by the USACE-SAD laboratory is included in this report. The chemical parameters for which the samples were analyzed, are identified below:

Parameter (Method)
TCL Volatile Organics by GC/MS SW-846 8260B
TCL Semivolatiles by GC SW-846 8270C
Metals by SW-846 6010B and 7470A/7471A
Chlorinated Pesticides by SW-846 8081A
Organophosphorous Pesticides by SW-846 8141A
PCBs by SW-846 8082
Herbicides by SW-846 8151A
Wet Chemistry -Total Organic Chemistry by SW846-9060 and Total Cyanide by SW846-9010

2.0 Procedures

The sample data were validated following the logic identified in the *USEPA Contract Laboratory Program (CLP) National Functional Guidelines For Inorganic Data Review (February 1994)* and *USEPA Contract Laboratory Program National Functional Guidelines For Organic Review (February 1994)* for all areas except Blanks. *Region III Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses (April 1993)* and *Region III National Functional Guidelines for Organic Data Review (June 1992)* were applied to the areas associated with blank contamination. Specific quality control (QC) criteria, as identified in the Quality Assurance Plan (QAP), analytical methods, and laboratory Standard Operating Procedures (SOP's) were applied to all sample results. As the result of the use of Update III SW846 test methods for the analytical data and the application of the CLP guidelines during the validation

process, there were instances where specific QC requirements for all target compounds were not defined. This primarily occurred in the organic, Gas Chromatograph (GC) and Gas Chromatograph/Mass Spectra (GC/MS) calibration areas and is due to the fact that the analytical methods are "performance-based", and allows the use of average calibration responses, in lieu of, individual responses, which are defined by CLP protocol. In light of applying CLP guidelines to SW846 methods and evaluating the usability of the data during the validation process, specific QC criteria were determined to address all target compounds and are identified in this report for each parameter, as well as, in the validation checklists, which function as worksheets. All completed validation checklists are on file in the Knoxville office. For those analytical methods not addressed by the CLP and Region III guidelines, the validation was based on the method requirements (i. e. SW846, CFR, SOP's, QAP) and technical judgement following the logic of the CLP validation guidelines.

3.0 Summary of Data Validation Findings

The overall quality of the data was determined to be acceptable. The only rejected data ('R' qualified) was due to "poor performing" volatile compounds (ketones, some halogenated hydrocarbons, e.g.), which exhibited poor calibration responses in the associated calibration data, and samples that were reanalyzed and have more than one result reported. The 'R' qualifier was assigned to the samples with more than one set of results to indicate that a given result should not be used to characterize a particular constituent or an analysis for a given sample.

Individual validation reports have been prepared for each parameter in each SDG and the overall results of the validation findings are summarized in this report. The validation qualifier data entry verification report (Attachment A) is also provided. This is a complete listing of all of the analytical results and the validation qualifiers assigned for FTA-93 sites. It also identifies the 'use' column, which indicates which result to use in the event of a reanalysis. A listing of the validation qualifiers and the reason codes, along with their definitions is also found in Attachment A. The following section highlights the key findings of the data validation for each analysis.

4.0 Analysis-Specific Data Validation Summaries

4.1 Volatile Organics by GC/MS SW846-8260B

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibration

All initial and continuing calibrations associated with the project samples met QC criteria, with the exceptions of the following:

- The following demonstrated RRFs below 0.1 in the ICAL and/or CCAL: Non-detect results were rejected (qualified 'R'); Positive results were estimated (qualified 'J'); Unless 'B' qualified due to blank contamination

Surrogate Recoveries

All surrogate recoveries are within acceptable QC limits.

Matrix Spike / Matrix Spike Duplicate

MS/MSD and Laboratory Control Sample (LCS) was performed for the project samples and all QC criteria were met.

Field Duplicates

Original and field duplicate results were evaluated and no problems were noted with the exception of the following:

Note: Soil-50% criteria applied. Water-35% criteria applied.

SDG	Samples Affected	Analyte/Analytes	Validation Qualifier
PK49303	DA0055 (original), DA0056 (field duplicate)	p-Isopropyltoluene	J
PK49303	DA1005 (original), DA1006 (field duplicate)	Acetone, 2-Butanone	J
PK49304	DA3003 (original), DA3006 (field duplicate)	Carbon Disulfide	J

Internal Standards

All internal standards met criteria with the exception of the following:

- All compounds associated with the internal standards listed in the table below were qualified as indicated.

SDG	Samples Affected	Internal Standard Outside QC Limits	Validation Qualifier
PK49301	DA0006, DA0007, DA0008, DA0009, DA0011, DA0014, DA0015, DA0020, DA0042, DA0044	1,4-Dichlorobenzene-d4	UJ/J

Quantitation

Results quantified between the MDL and the RL, which the lab qualified as "J," were qualified as estimated 'J' unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected 'R'.

4.2 TCL Semivolatiles by GC/MS SW-846 8270C

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples with the exception of the reanalysis of sample WS0001 from SDG WSHED05, all results were estimated (qualified 'J/UJ'), as applicable.

Initial and Continuing Calibration

All initial and continuing calibrations associated with the project samples met QC criteria with the exceptions of the following:

The following exhibited individual ICAL %RSD>30 and/or CCAL %D>20:

Laboratory Control Sample (LCS)

All QC criteria were met for the LCS associated with the project sample analyses.

Interference Check Sample (ICS)

All ICS % recoveries, where applicable, were acceptable.

ICP Serial Dilutions

All QC criteria were met with the following exceptions:

SDG	Samples Affected	Element/Elements	Validation Qualifier
PK49302	DA0013, DA0017, DA0018, DA0019, DA0021, DA0022, DA0028, DA0029, DA0049, DA0051, DA0053, DA0061, DA0062	Iron, Vanadium, Zinc	*B/J

* 'B' qualifiers assigned to designate blank contamination, which are identification qualifiers, take precedence over estimating qualifiers, assigned due to quantitation.

Field Duplicates

Original and field duplicate results were evaluated and the following exceeded the 35 % RPD criteria for waters or 50 % RPD criteria for soils.

SDG	Samples Affected	Element/Elements	Validation Qualifier
PK49301	DA0010 (original), DA0011 (duplicate)	Calcium, Magnesium	J
PK49303	DA0024 (original), DA0025 (duplicate)	Manganese, Vanadium	J

PK49304	DA2005 (original), DA2006 (duplicate)	Iron	J

* 'B' qualifiers assigned to designate blank contamination, which are identification qualifiers, take precedence over estimating qualifiers, assigned due to quantitation.

Note: High RPD's are most likely due to matrix interferences and/or sample non-homogeneity

Sample Quantitation

Results quantified between the IDL and the RL ("B" flagged by the laboratory) were qualified as estimated (J).

4.4 Chlorinated Pesticides by SW-846 8081A

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibration

All initial and continuing calibrations associated with the project samples met QC criteria, with the exception of the following:

- The following exhibited individual primary CCAL %D>15 and/or confirmation %D>25% : Non-detect results were estimated (qualified 'UJ'); Positive results were estimated (qualified 'J'); Unless 'B' qualified due to blank contamination

SDG	Samples Affected	Analyte/Analytes	Validation Qualifier

PK49305	DA0031, DA0032, DA0033, DA0034	4,4' - DDT, 4,4' - DDD, Heptachlor, Methoxychlor	UJ/J

Blanks

The 5X rule for contaminants found in the associated equipment rinses and method blanks was applied to all sample results. All were found to be acceptable.

Surrogate Recoveries

All surrogate recoveries are within acceptable QC ranges for the surrogates applied.

Matrix Spike / Matrix Spike Duplicate

MS/MSD and Laboratory Control Sample (LCS) were performed for the project samples and all QC criteria were met.

Field Duplicates

Original and field duplicate results were evaluated and no problems were identified.

Quantitation

Results quantified between the MDL and the RL, which the lab qualified as "J," were qualified as estimated 'J' unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected 'R'.

4.5 Organophosphorous Pesticides by SW-846 8141A

4.6 PCBs by SW-846 8082

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibration

All initial and continuing calibrations associated with the project samples met QC criteria with exception of the following:

- Sample DA0028 from PK49302 was "J" qualified, by professional judgement, for Aroclor 1254 due to an altered chromatograph.

- The following exhibited individual primary CCAL %D>15 and/or confirmation %D>25% : Non-detect results were estimated (qualified 'UJ'); Positive results were estimated (qualified 'J'); Unless 'B' qualified due to blank contamination

PK49301	DA1001, DA1003	TOC	J

Laboratory Control Sample (LCS)

All QC criteria were met for the LCS associated with the project sample analyses.

Field Duplicates

Original and field duplicate results were evaluated and no problems were noted.

Quantitation

Results quantified between the MDL and the RL, which the lab qualified as "J," were qualified as estimated 'J' unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected 'R'.

5.0 Quality Assurance Field Split Sample Data Evaluation

Data from the quality assurance split samples supplied to IT by the USACE were reviewed for comparability to the original and field duplicate results. Relative percent differences were calculated and the results are summarized in this section.

Field split data for SDG PK49301

Note: Field Split Laboratory - Specialized Assays, Inc., Nashville, TN

Original Sample ID	Field Duplicate ID	Field Split ID
DA0010	DA0011	DA0012

Comments:

- Volatiles - Acetone, and Methylene Chloride were detected in original and field duplicate (FD); but not detected in the field split (FS). Re-analysis of DA0010 and DA0011 showed all compounds to be non-detects. Difference attributed to lack of sample homogeneity, different reporting limits (RL), and/or FS lab does not report results below the RL's. It should also be noted that the reanalysis of the original and the FD samples were diluted 5:1 and the original and duplicate samples were not diluted.

- Semivolatiles - The original runs for the original sample and the duplicate sample experienced low Internal Standard (IS) Area's. The samples were diluted 5:1 and all compounds were found to be non-detects. The re-analysis results are the reported results since the IS area counts were acceptable. Therefore all three samples were non-detect for all compounds.

- Metals - The majority of the same elements were detected at comparable concentrations for all samples. Calcium had a high %RSD= 77.7. Several elements had RPDs > 50%. The high %RPD's are attributed to lack of sample homogeneity and matrix interferences. Nickel, potassium, and sodium were detected in the FS and not detected in the original. Differences attributed to the use of different RL's, lack of sample homogeneity, and/or original and FD lab did not report results below the RL's.

- Pesticides, OP Pesticides, Herbicides, PCBs: No compounds were detected in original, FD or FS.

- Cyanide was only detected in the FS. This may be due to a lack of sample homogeneity.

Note: Field Split Laboratory - Specialized Assays, Inc., Nashville, TN

Original Sample ID	Field Duplicate ID	Field Split ID
DA0024	DA0025	DA0026

Comments:

- Metals: Majority of the same metals detected in all three samples. Several elements have RPD values above the QC limit. Differences were attributed to lack of homogeneity in soil samples and FS lab not reporting results below the reporting limit.

- Volatiles: No volatiles were detected in the FS. Acetone and methylene chloride, common laboratory contaminants were detected below the reporting limit in the original and FD.

- Semivolatiles: No semivolatiles detected in the FS. Bis (2-Ethylhexyl) phthalate was detected below the reporting limit in the FD. Phthalates are common laboratory contaminants.

- Pesticides, OP Pesticides, Herbicides, PCBs and Total Cyanide: No compounds detected in original, FD or FS samples.

Comments:

- Metals: Majority of the same metals detected in all three samples. Arsenic, chromium, and iron have RPD values above the QC limit. Differences were attributed to lack of homogeneity in soil samples and FS lab not reporting results below the reporting limit.

- Volatiles: Acetone, 2-butanone, and methylene chloride, common laboratory contaminants were detected below the reporting limit in the original and FD. All three samples were detects for p-Isopropyltoluene. A different extraction method for the duplicate showed a non-detect result.

- Semivolatiles: No semivolatiles detected in the original or FS. Phenol was detected between the IDL and the reporting limit in the FD.

- Pesticides, OP Pesticides, Herbicides, PCBs and Total Cyanide: No compounds detected in original, FD or FS samples.

DA0058	DA0059	DA0060

Comments:

- Volatiles: Acetone, 2-butanone, and methylene chloride, common laboratory contaminants were detected below the reporting limit in the original and FD. All three samples were detects for Carbon disulfide. The original was detected for p-Isopropyltoluene.

- Semivolatiles, Metals, Pesticides, OP Pesticides, Herbicides, PCBs and Total Cyanide: No compounds detected in original, FD or FS samples.

Note: Field Split Laboratory - Specialized Assays, Inc., Nashville, TN

Original Sample ID	Field Duplicate ID	Field Split ID
DA1005	DA1006	DA1007

Comments:

- Metals: Majority of the same metals detected in all three samples. Several elements showed very high RPD values (>100%) above the QC limit. Differences were attributed to lack of homogeneity in soil samples and FS lab not reporting results below the reporting limit.

- Volatiles: No volatiles were detected in the FS. Acetone, 2-butanone, toluene and methylene chloride, common laboratory contaminants were detected below the reporting limit in the original and FD. Carbon disulfide was detected in the original and the FD.

Differences were attributed to lack of homogeneity in soil samples and FS lab not reporting results below the reporting limit.

- Semivolatiles: No semivolatiles were detected in the FS. Bis(2-ethylhexyl) phthalate, a common laboratory contaminant, was detected in the original and the FD. Benzo(b) fluoranthene was detected in both the original and the FD. Benzo(k) fluoranthene was detected in the FD, and Fluoranthene was detected only in the original. All compounds were detected between the IDL and the reporting limit.

- Pesticides: Compound, 4,4'-DDE was detected in the original and the FD, but not in the FS. Differences were attributed to lack of homogeneity in soil samples and FS lab not reporting results below the reporting limit.

- Total Cyanide: Cyanide was detected in the FS.

- Total Organic Carbon: TOC was detected in all three samples. The RPD was 197.2% for the original and the FD.

- OP Pesticides, Herbicides, PCBs: No compounds detected in original, FD or FS samples.

Note: Field Split Laboratory - Specialized Assays, Inc., Nashville, TN

Original Sample ID	Field Duplicate ID	Field Split ID
DA2005	DA2006	DA2007

Comments:

- Metal: The same metals detected in all samples were at comparable levels. Calcium, iron, magnesium, and manganese were detected in all three samples. Aluminum, barium, potassium, and sodium were detected in the FS. The results were between the MDL and the RL for the FS.

- Volatiles: No volatiles were detected in the FS. Acetone, a common laboratory contaminant and trichloroethene were detected below the reporting limit in the original and FD.

- Semivolatiles: No semivolatiles detected in the FS. Phenol was detected in the original and FD, but were below the reporting limit.

- Total Cyanide: Cyanide was detected in the FS.

- Pesticides, OP Pesticides, Herbicides, PCBs: No compounds detected in the original, FD or in the FS.

Field split data for SDG PK49304

Note: Field Split Laboratory - Specialized Assays, Inc., Nashville, TN

Original Sample ID	Field Duplicate ID	Field Split ID
DA3003	DA3006	DA3007

Comments:

- Metal: The same metals detected in all samples were at comparable levels. All metals detected in FS and not in the original and FD were below the reporting/quantitation limit of the original lab. Lead, chromium and zinc had RPD's above the QC limit. Differences possibility due to field activities in sampling well waters.

- Volatiles: No volatiles detected in the FS. Acetone, a common laboratory contaminant and carbon disulfide were detected below the reporting limit in the original and FD.

- Semivolatiles: No semivolatiles detected in the FS. All semivolatiles detected in the original and FD were below the reporting limit. Bis (2-Ethylhexyl) phthalate and Di-n-butyl phthalate are common laboratory contaminants.

- Pesticides, OP Pesticides, Herbicides, PCBs: No compounds detected in original, FD or FS samples.

Data Validation Qualifier Entry Verification Report

Validation Qualifiers

U Not detected. The compound/analyte was analyzed for, but not detected above the associated reporting limit.

J The compound/analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed.

B The concentration reported was detected significantly above the levels reported in the associated equipment rinse samples and/or laboratory method and trip blanks. (5X/10X Rule was applied).

R The reported sample results are rejected due to the following:

1. Severe deficiencies in the supporting quality control data.
2. Anomalies noted in the sampling and/or analysis process which could affect the validity of the reported data.
3. The presence or absence of the constituent cannot be verified based on the data provided.
4. To indicate not to use a particular result in the event of a reanalysis.

UJ The compound/analyte was analyzed for, but not detected above the established reporting limit. However, review and evaluation of supporting QC data and/or sampling and analysis process have indicated that the "nondetect" may be inaccurate or imprecise. The nondetect result should be estimated.

Quality Assurance Report for the
Site Investigation Performed at the
Former Decontamination Complex, Parcels 93(7), 46(7), 70(7), and 140(7)
Project No. 774645

1.0 Overview

Four soil samples and twelve groundwater samples were collected in support of the supplemental sampling investigation at Fort McClellan (FTMC) Parcel FTA-93, Former Decontamination Complex Building 1271. Samples were submitted to EMAX Laboratories, Inc. for analysis. QC samples consisted of the following types and quantities: 2 field duplicates, 2 matrix spike/matrix spike duplicate (MS/MSD) pairs, 10 trip blanks and 3 equipment rinsates. Analytical summaries cross-referencing sample location, sample number, and contaminants of concern is presented in Attachment A.

One hundred (100%) percent of samples were validated and reviewed in accordance with the *USEPA Contract Laboratory Program National Functional Guidelines for Evaluating Inorganic Data Review (EPA, February 1994)* and *USEPA Contract Laboratory Program National Functional Guidelines for Organic Review (EPA, October 1999)* for all areas except blanks. Region III *Laboratory Data Validation Functional Guidelines for Inorganic Analyses (EPA, April 1993)* and Region III *National Functional Guidelines for Organic Data Review (EPA, June 1992)* were applied to the areas associated with blank contamination. Data qualifiers assigned to results were based on guidance outlined in the referenced documents and the *Installation-Wide Sampling and Analysis Plan (IT, March 2000)* for FTMC.

Table 1.0-1
Laboratory Data Qualifier Definitions

Data Qualifier	Laboratory Data Qualifier Definition
B	Analyte detected in method blank at concentration greater than the reporting limit (and greater than zero).
C	Confirming data obtained using second GC column or GC/MS.
E	Analyte concentration exceeded calibration range.
I	Analyte identification suspect. See narrative for explanation.
J	Result is less than or equal to specified reporting limit but greater than the method detection limit (MDL).
P	Analyte not confirmed. Results from primary and secondary GC columns differ by greater than 10 percent
S	Analyte concentration obtained using Method of Standard Additions (MSA).
U	Not detected. The value represented indicates the reporting limit for the analysis.
D	Sample analyzed as a dilution. The result reported has been calculated using the appropriate dilution factor.
No Code	Confirmed identification.

Table 1.0-2
Validation Data Qualifier Definitions

Validation Qualifier	Validation Data Qualifier Definition
U	Not detected. The associated number indicates approximate sample concentration necessary to be detected.
No Code	Confirmed identification.
B	Not detected substantially above the level reported in laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
N	Tentative identification. Consider present. Special methods may be needed to confirm its presence or absence in future sampling efforts.
J	Analyte present. Reported value may not be accurate or precise. Considered an estimate.
NJ	Qualitative identification questionable due to poor resolution. Presumptively present at approximate quantity.
NV	Result was not validated.

The Data Validation Summary Report is presented in Attachment B.

2.0 Summary

Data were evaluated to verify compliance with precision, accuracy, representativeness, comparability, completeness, and sensitivity. To verify that project data quality objectives (DQOs) were met, laboratory analytical results and data packages were examined for compliance with SW846 8260B, 8330, and 6010B/7470A/7471A series quality control (QC) method criteria. Laboratory nonconformances and discrepancies in the data were also examined to determine their impact on the data. The results of this review are presented in the following sections.

2.1 Sample Receipt and Analytical Holding Times

All sample results generated by the laboratory during this investigation have been reviewed with respect to condition of samples as received by the laboratory, chain-of-custody, and analysis holding times. All coolers were received by EMAX in good condition under proper chain-of-custody.

All extraction and analytical holding times were met.

2.2 Rejected Data

Table 2.2-1 lists all rejected analytical data. Sample re-collection at this time is not warranted due to all rejected results being reported as non-detect.

Table 2.2-1 Rejected Analytical Results

2.3 Blank Results

Descriptions of the type of blank samples which were collected, processed, and evaluated for background and/or process contamination during this sampling are as follows:

- Trip blanks (TBs) consist of aqueous VOC sample vials filled in the laboratory with ASTM Type II reagent grade water, transported to the sampling site, handled like an environmental sample and returned to the laboratory for analysis. Trip blanks are prepared only when aqueous VOC samples are collected and analyzed. Trip blanks are used to assess the potential introduction of contaminants from sample containers during the transportation and/or storage procedures. Trip blanks were sent with all aqueous samples shipped to the laboratory requiring volatile analysis.

- Equipment rinsates (ER) are samples of analyte-free deionized water poured into, over, or pumped through the sampling device, collected in a sample container, and transported to the laboratory for analysis. Equipment rinsates are used to assess the effectiveness of equipment decontamination procedures.

- Method blanks (MB) are used in the laboratory to assess and document any possible contamination resulting from the analytical process. A method blank is an analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank shall be carried through the complete sample preparation and analytical procedure.

- Initial and continuing calibration blanks (ICB and CCB) are instrument blanks consisting of an analyte-free matrix. ICBs and CCBs are analyzed to verify the analysis system is free of contamination and are analyzed immediately after the initial and continuing calibrations are performed.

When target compounds are detected in trip blanks, equipment rinsates, method blanks and/or initial/continuing calibration blanks there is increased uncertainty regarding the positive identification of the same constituents in field samples. When this occurs, detections more than five times the associated blank concentration are assumed to be positive detections in field samples. Because of the added uncertainty for certain "common" laboratory contaminants such as acetone, chloroform, toluene, and various phthalates, these constituents are not assumed present until sample concentrations exceed ten times the associated blank value. This is referred to as the 5X/10X rule.

Field sample concentrations were evaluated to determine if the sample results could have been biased by the presence of any contamination measured in trip blanks, equipment rinsate blanks, method blanks and/or initial/continuing calibration blanks. Sample data affected by blank contamination are summarized in Table 2.3-1.

Table 2.3-1
Summary of Blank Contamination

	DA3021	Lead	Lead result for sample DA3021 was "B" qualifed due to ICB/CCB contamination.
1093-04	DA3012	Methylene chloride	Methylene chloride result for sample DA3012 was "B" qualified due to MB, ER and TB contamination.
		Arsenic	Arsenic result for sample DA3012 was "B" qualified due to MB contamination.

2.4 Analytical Precision

Precision is defined as a measurement of mutual agreement among individual measurements of the same property, usually under "prescribed similar conditions." Analytical precision is calculated as relative percent difference (%RPD) based on the following formula:

$$\%RPD = \left| \frac{(A-B)}{(A+B)/2} \right| \times 100$$

where:

%RPD = Relative Percent Difference
A = original result
B = duplicate result

A high RPD between an original sample and its field duplicate may be attributable to the difference in sample matrix or distribution of the contaminant within the sample, rather than the

precision of the collection process. Also, when "estimated" results are reported, there is a potential for increased variability between the primary and duplicate sample results. This occurs because, at low concentrations, the relative difference in results is magnified by the RPD calculation even though the results are comparable in absolute terms. There is also increased uncertainty in the results as the lower limit of detection is approached, due to decreasing analytical accuracy. The RPD calculation cannot be performed in cases where non-detected results are reported with corresponding samples that contain detectable concentrations.

Overall sampling and analysis precision for this task was assessed using field duplicate (FD) samples. Laboratory precision was assessed by laboratory control sample/laboratory control sample duplicate (LCS/LCSD) and matrix spike/matrix spike duplicate (MS/MSD) recoveries. Results indicate that an acceptable analytical precision was achieved. Table 2.4-1 lists precision acceptance criteria for LCS/LCSD, MS/MSD organic analyses and field duplicate comparisons. Table 2.4-2 lists all field duplicate, LCS/LCSD and MS/MSD RPDs that exceeded QC criteria.

Table 2.4-1 Precision Acceptance Criteria

Field/Laboratory QC Type	Matrix	
	Aqueous	Soil

Table 2.4-2
Summary of Field Duplicate, LCS/LCSD & MS/MSD RPD Anomalies

Sample Delivery Group	Sample Number	Contaminant	Assigned Validation Qualifier
1093-01	DA3013 (Parent) / DA3014 (FD)	Arsenic (50%)	Arsenic results for samples DA3013 and DA3014 should be considered estimated ("J" qualified) due to RPD between parent sample and its corresponding field duplicate exceeding QC criteria. However, due to blank contamination arsenic for both samples were "B" qualified.
1093-02	DA0067 MS/MSD	Magnesium (21%)	Magnesium results for samples DA3067 through DA3070 were "J" qualified due to MS/MSD RPD exceeding QC criteria.

2.5 Analytical Accuracy Assessment

Accuracy is a measure of the degree of agreement of a result against an accepted reference or true value. Accuracy is expressed as a percent recovery (%R) calculated by the ratio of the measurement and accepted true value as shown in the following equation:

$$\%R = (|X_s - X_u|/K) \times 100$$

where:

X_s = measured value of the spiked sample
X_u = measured value of the unspiked sample
K = known amount of the spike in the sample

Surrogate recoveries, MS/MSD and LCS/LCSD were used to measure analytical accuracy as described in SW846 8260B, 8330, and 6010B/7470A/7471A. Reported results indicate that an acceptable level of analytical accuracy was achieved. Surrogate, Internal Standard, LCS/LCSD and MS/MSD spike recoveries, which exceed QC criteria are summarized in Table 2.5-1.

Table 2.5-1
Summary of Surrogate, LCS/LCSD and MS/MSD Spike Recovery Criteria Exceedances

Sample Delivery Group	Sample Number	Contaminant	Action
1093-01	IPL004 WC (LCSD)	Iron (HB) Magnesium (HB) Sodium (HB) Aluminum (HB) Arsenic (HB)	Iron, magnesium and sodium results for samples DA3013, DA3014, DA3015, DA3018, DA3019, DA3020 and DA3023 were "J" qualified due to LCS spike recoveries exceeding QC criteria. Aluminum results for samples DA3013, DA3014, DA3018, DA3019 and DA3020 should be considered estimated ("J" qualified) but due to blank contamination results were "B" qualified. Arsenic results for samples DA3013, DA3014, DA3015 and DA3019 should be considered estimated ("J" qualified) but due to blank contamination results were "B" qualified.
1093-02	DA0067 MS/MSD	Antimony (LB) Magnesium (LB,HB) Barium (HB) Thallium (LB)	Antimony, magnesium, barium and thallium results for samples DA0067 through DA0070 were "UJ" / "J" qualified due to MS/MSD spike recoveries exceeding QC criteria.

LB - Low bias
HB - High bias

2.6 Data Representativeness

Representativeness is a qualitative parameter that expresses the degree to which sample data actually represent the matrix conditions. Standardized requirements and procedures for

sample collection, handling and analyses were employed to maximize sample representativeness.

Soil sample locations selected for this investigation will confirm whether the has been impacted by contaminant releases from former activities at this site. Groundwater samples were collected to determine the quality of groundwater in the aquifier.

2.7 Data Comparability

Comparability is a qualitative parameter expressing the confidence with which one data set can be compared with another. By employing well-recognized techniques and accepted standardized methods for sampling and analysis, data comparability was achieved during this sampling event.

2.8 Data Completeness

Completeness is calculated for the aggregation of data for each analyte measured during the supplemental sampling investigation of Parcel FTA-93, Former Decontamination Complex Building 1271. The formula for calculating completeness is listed below:

$$\% \text{ Completeness} = (X_V / X_T) \times 100$$

where:

X_V = number of valid (i.e., non-"R"-flagged) results
X_T = number of possible results

Parcel FTA-93 goal for completeness is 95% for both aqueous and soil samples. The % Completeness for this task is calculated to be 96.0%.

- % Completeness = (1252 / 1304) x 100 = 96.0%

2.9 Sensitivity

Sensitivity is defined as the ability of the laboratory's established method detection limits (MDL)/method reporting limits (MRL or RL) to meet project-specific DQOs or site-specific screening levels (SSSL) and or ecological screening values (ESV).

MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero. MDLs are determined from an analysis of a sample in a given matrix containing the target analyte of interest. The MRL is a threshold value based upon the sensitivity capability of method and instrument. MRLs are normally set at a minimum of two times the MDL. MRLs are adjusted based on the sample matrix, moisture (solids only), and any necessary sample dilutions. The laboratory cannot reliably

quantitate values reported above the MDL but below the MRL. Therefore, these analyte values must be flagged as estimated quantities ("J"-flagged).

To evaluate method sensitivity, a general comparison of the laboratory's MDLs/MRLs and the site investigation screening levels (background values, human health SSSL for residential reuse, and ESV) was performed and presented to the FTMC Base Realignment and Closure Team (BCT) (November 1999). The comparison summarized the relationship between the MDL/MRLs and SSSL/ESVs for each parameter typically reported for all of the major analytical methods used at FTMC. The few cases identified where the MDL and/or MRL values exceeded their corresponding human health SSSL and/or ESV were specifically highlighted and explained. It was understood that for these cases, the standard analytical method of analysis was not going to provide MDLs/MRLs, which met human health SSSLs or ESVs without significant uncertainty and the possibility of reporting false negatives. It was generally accepted that standard EPA SW846 analytical methods would provide sufficient sensitivity for data reported and used in the site screening process at FTMC.

3.0 Data Usability

Data quality indicators (DQI) provide an internal guide for control and review to verify that data are scientifically sound, defensible, and of known and acceptable quality. Factors such as precision, accuracy, representativeness, comparability, completeness, and sensitivity were evaluated to determine if the project's DQOs were met. A review of the data revealed that the majority of QA/QC indicators were within acceptable control limits. Any data anomalies encountered during data validation and overall site evaluations have been summarized in the previous sections of this document.

Based on the results of data validation and QA review, IT has concluded that representative samples were collected and analyzed and the results are indicative of the media analyzed. The data are to be considered representative of site conditions and are usable for their intended purpose.

DATA VALIDATION SUMMARY REPORT

Data Validation Summary Report
For the Supplemental Site Investigation Performed at the
Former Decontamination Complex, Parcels 93(7), 46(7), 70(7), and 140(7)
Fort McClellan, Calhoun County, Alabama

1.0 Introduction

Level III data validation was performed on 100 percent of the environmental samples collected for FTA-93. The analytical data consisted of delivery groups (SDGs) 1093-01, 1093-02, 1093-03, and 1093-04, which were analyzed by EMAX Laboratories. Soil and water matrices were validated. The chemical parameters for which the samples were analyzed, are identified below:

Parameter (Method)
Volatile Organics by GC/MS SW846 8260B
Metals by SW846 6010B and 7470A/7471A
Nitroaromatic and Nitramine Explosives by SW846 8330

2.0 Procedures

The sample data were validated following the logic identified in the 1994 *EPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* and the 1999 *EPA Contract Laboratory Program National Functional Guidelines for Organic Review* for all areas except blanks. *EPA Region III Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses* (April 1993) and *Region III National Functional Guidelines for Organic Data Review* (June 1992) were applied to the areas associated with blank contamination. Specific quality control (QC) criteria as identified in the quality assurance plan (QAP), analytical methods, and laboratory standard operating procedures (SOP) were applied to all sample results. As a result of the use of Update III SW846 test methods for the analytical data and the application of the Contract Laboratory Program (CLP) guidelines during the validation process, there were instances where specific QC requirements for all target compounds were not defined. This primarily occurred in the organic, gas chromatography (GC) and GC/mass spectrometry (MS) calibration areas and is due to the fact that the analytical methods are performance-based and allow the use of average calibration responses in lieu of individual responses, which are defined by CLP protocol. In light of applying CLP guidelines to SW846 methods and evaluating the usability of the data during the validation process, specific QC criteria were determined to address all target compounds and are identified in this report for each parameter, as well as in the validation checklists, which function as worksheets. All completed validation checklists are on file in the Knoxville office. For those analytical methods not addressed by the CLP and Region III guidelines, the validation was based on the method requirements (i.e., SW846, Code of Federal Regulations, SOPs) and technical judgement, following the logic of the CLP validation guidelines.

3.0 Summary of Data Validation Findings

The overall quality of the data was determined to be acceptable with minimal qualifications. The only rejected data ("R" qualified) was due to "poor performing" volatile compounds (ketones, some halogenated hydrocarbons, etc.), which experienced poor calibration responses in the associated calibration data, and samples that were reanalyzed and have more than one set of results reported. The "R" qualifier was assigned to the samples with more than one set of results to indicate that a given result should not be used to characterize a particular constituent or an analysis for a given sample.

Individual validation reports have been prepared for each parameter, and the overall results of the validation findings are summarized in this report. The validation qualifier data entry verification report (Attachment 1) is also provided. This is a complete listing of all of the analytical results and the validation qualifiers assigned for the site investigation at FTA-93. It also identifies the "use" column, which indicates which result to use in the event of a reanalysis. A listing of the validation qualifiers and the reason codes, along with their definitions, is also found in Attachment 1. The following section highlights the key findings of the data validation for each analysis.

4.0 Analysis-Specific Data Validation Summaries

4.1 Volatile Organics by GC/MS SW846 8260B

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibration

The initial calibration (ICAL) and continuing calibrations (CCAL) associated with the project samples met QC criteria with the following exception(s):

- The following exhibited individual ICAL/CCAL relative response factor (RRF) <0.1:

SDG Number	Samples Affected	Compound(s)	Validation Qualifier
1093-01	DA3013, DA3014, DA3015, DA3018, DA3019, DA3020, DA3023	1,2-Dibromo-3-chloropropane, 2-Butanone (MEK), 2-Hexanone (MBK), 4-Methyl-2-pentanone (MIBK), Acetone	J/R
1093-03	DA3016, DA3017, DA3021, DA3022	1,2-Dibromo-3-chloropropane, 2-Butanone (MEK), 2-Hexanone (MBK), 4-Methyl-2-pentanone (MIBK), Acetone	J/R

SDG Number	Samples Affected	Compound(s)	Validation Qualifier
109-04	DA3012	1,2-Dibromo-3-chloropropane, 2-Butanone (MEK), Acetone	R

- The following exhibited individual CCAL percent difference (%D) >20:

SDG Number	Samples Affected	Compound(s)	Validation Qualifier
1093-01	DA3013, DA3014, DA3015, DA3018, DA3019, DA3020, DA3023	1,2-Dibromo-3-chloropropane, 2-Butanone (MEK), Dichlorodifluoromethane	R/UJ
	DA3013, DA3014	Acetone	J
	DA3013, DA3014, DA3018, DA3019	1,2,3-Trichloropropane	UJ
1093-03	DA3016, DA3017, DA3021, DA3022	1,2-Dibromo-3-chloropropane, 2-Butanone (MEK), 1,2,3-Trichloropropane, Dichlorodifluoromethane	R/UJ
	DA3016, DA3022	Bromoform	UJ
	DA3021	1,1,1,2-Tetrachloroethane	UJ
	DA3022	Acetone	R
1093-04	DA3012	2-Butanone (MEK), Acetone, 2-Hexanone (MBK), 4-Methyl-2-pentanone (MIBK), Bromomethane	R/UJ

Blanks

The 5X/10X rule for contaminants found in the associated equipment rinses, trip blanks, and method blanks was applied to all sample results. All were found to be acceptable with the following exception(s):

SDG	Samples Affected	Compound(s)	Blank Contaminant	Validation Qualifier
1093-01	DA3015, DA3020, DA3023	Methylene chloride	ER/TB	B
	DA3019	Chloroform	TB	B
1093-03	DA3016, DA3017, DA3022	Methylene chloride	ER/TB	B
1093-04	DA3012	Methylene chloride	Method/ER/TB	B

Surrogate Recoveries

All surrogate recoveries were within QC limits.

Matrix Spike / Matrix Spike Duplicate

Matrix Spike/Matrix Spike Duplicate (MS/MSD) analysis was performed for the project samples,

and all QC criteria were met.

Laboratory Control Sample

Laboratory Control Sample (LCS) analysis was performed for the project samples, and all QC criteria were met.

Field Duplicates

Original and field duplicate results were evaluated and no problems were identified.

Internal Standards

All internal standards met QC criteria.

Quantitation

Results quantitated between the method detection limit (MDL) and the reporting limit (RL), which the lab qualified as "J", were qualified as estimated "J" unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected "R".

4.2 Metals by SW846 6010B/7470A/7471A

Overall, the data are of good quality and are usable as reported by the laboratory with the exceptions noted below. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibrations

All initial and continuing calibrations associated with the project samples met QC criteria.

Blanks

The 5X rule for contaminants found in the associated equipment rinse, calibration, and method blanks was applied to all sample results. All criteria were acceptable with the following exception(s):

SDG	Samples Affected	Compound(s)	Blank Contaminant	Validation Qualifier
1093-01	DA3013, DA3014, DA3018, DA3019, DA3020	Aluminum	Calibration	B
	DA3013, DA3014, DA3015, DA3019	Arsenic	Method	B
	DA3014, DA3020	Thallium	Calibration	B

SDG	Samples Affected	Compound(s)	Blank Contaminant	Validation Qualifier
	DA3018, DA3019	Mercury	Method	B
1093-03	DA3016, DA3017, DA3021, DA3022	Arsenic	Method/Calibration	B
	DA3021	Lead	Calibration	B
1093-04	DA3012	Arsenic	Method	B

Matrix Spike / Matrix Spike Duplicate

MS/MSD analysis was performed for the project samples, and all QC criteria were met with the following exception(s):

SDG	Samples Affected	Compound(s)	Validation Qualifier
1093-02	DA0067, DA0068, DA0069, DA0070	Antimony, Barium, Magnesium, Thallium	J/UJ

Laboratory Control Sample

LCS analysis was performed for the project samples, and all QC criteria were met with the following exception(s):

SDG	Samples Affected	Compound(s)	Validation Qualifier
1093-01	DA3013, DA3014, DA3015, DA3018, DA3019, DA3020, DA3023	Iron, Magnesium, Sodium	J
	DA3013, DA3014, DA3018, DA3019, DA3020	Aluminum	B
	DA3013, DA3014, DA3015, DA3019	Arsenic	B

Interference Check Sample All Interference Check Sample (ICS) percent recoveries were acceptable. All QC criteria were met.

Inductively Coupled Plasma Serial Dilutions

All QC criteria were met for the serial dilutions associated with the project samples with the following exception(s):

SDG	Samples Affected	Compound(s)	Validation Qualifier
1093-01	DA3013, DA3014, DA3015, DA3018, DA3019, DA3020, DA3023	Sodium	J
1093-02	DA3016, DA3017, DA3021, DA3022	Calcium, Iron	J

Field Duplicates

Original and field duplicate results were evaluated, and no problems were identified with the following exception(s):

SDG	Samples Affected	Compound(s)	Validation Qualifier
1093-01	DA3013 (original), DA3014 (FD)	Arsenic	*B

*"B" qualified due to method blank contamination.

Quantitation

Results quantified between the MDL and the RL, which the lab qualified as "J", were qualified as estimated "J" unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected "R".

4.3 Nitroaromatic and Nitramine Explosives by SW846 8330

Overall, the data are of good quality and are usable as reported by the laboratory. Data were reviewed for the following:

Holding Times

Technical holding time criteria were met for all samples.

Initial and Continuing Calibration

All initial and continuing calibrations associated with the project samples met QC criteria.

Blanks

The 5X rule for contaminants found in the associated equipment rinses and method blanks was applied to all sample results. All were found to be acceptable.

Surrogate Recoveries

All surrogate recoveries were within QC criteria.

Matrix Spike / Matrix Spike Duplicate

MS/MSD analysis was performed for the project samples, and all QC criteria were met.

Laboratory Control Sample

LCS analysis was performed for the project samples, and all QC criteria were met.

2ND Column Confirmation

The percent difference QC criteria between columns for analyte concentrations were met.

Field Duplicates

Original and field duplicate results were evaluated, and no problems were identified.

Quantitation

Results quantified between the MDL and the RL, which the lab qualified as "J", were qualified as estimated "J" unless blank contamination was present or the results were rejected. Results rejected in favor of a preferred result (e.g., due to dilution or reanalysis) were qualified as rejected "R".

Data Validation Qualifier Entry Verification Report

Validation Qualifiers

U Not detected. The compound/analyte was analyzed for, but not detected above the associated reporting limit.

J The compound/analyte was positively identified; the reported value is the estimated concentration of the constituent detected in the sample analyzed.

B The concentration reported was detected significantly above the levels reported in the associated equipment rinse samples and/or laboratory method and trip blanks. (5X/10X Rule was applied).

R The reported sample results are rejected due to the following:

1. Severe deficiencies in the supporting quality control data.
2. Anomalies noted in the sampling and/or analysis process which could affect the validity of the reported data.
3. The presence or absence of the constituent cannot be verified based on the data provided.
4. To indicate not to use a particular result in the event of a reanalysis.

UJ The compound/analyte was analyzed for, but not detected above the established reporting limit. However, review and evaluation of supporting QC data and/or sampling and analysis process have indicated that the "nondetect" may be inaccurate or imprecise. The nondetect result should be estimated.
